NATIONAL OCEANIC AND
ATMOSPHERIC ADMINISTRATION

NOAA's Next Generation Strategic Plan

A Presentation to Stakeholders

Paul Doremus

NOAA Director of Strategic Planning
Office of Program Planning and Integration

May 19th, 2009

What are the trends
that will shape our future?

How can we handle the many
uncertainties about the future?

How will NOAA develop strategy
for the long- and short-term?

How can you aid the
development of NOAA strategy?

Who will be NOAA's partners and customers?

One Laptop per Child

Over the Long-Term, We See Multiple Trends that are High Impact and Highly Uncertain

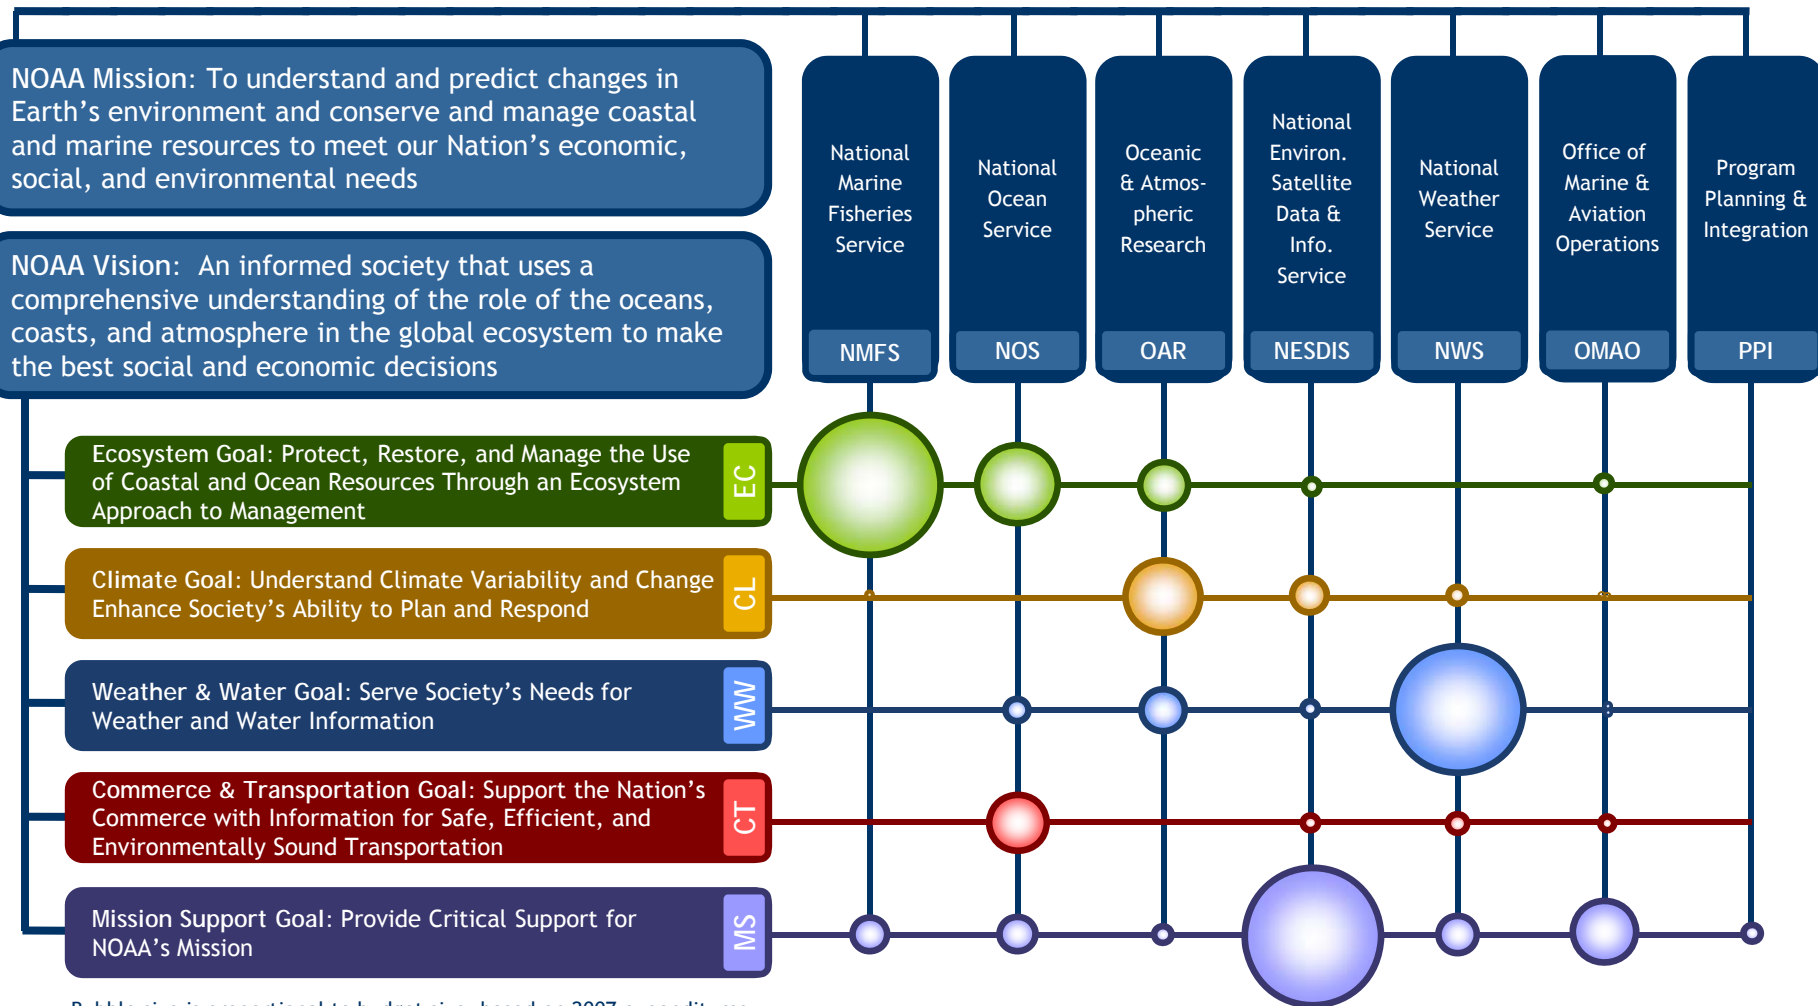

Trend	One Extreme	Another Extreme
Economic Production	business as usual	green, sustainable
Economic Growth	GDP focus	quality-of-life focus
Energy Demand	high growth	low growth
Energy Supply	alternative options	mostly fossil
Climate Change	abrupt, irreversible	slow, manageable
Public Attitude	irresponsible, unaware	informed, active
Fishery Management	stocks, species disappear	biodiversity, resilience
Federal Policy	laissez-faire	aggressive, proactive
Federal Budget	tight purse strings	loose purse strings
International Law	fragmented	collaborative
Information Sharing	interoperable standards	no standards

Will Current Strategy Remain Relevant Over the Long-Term?

NOAA Mission: To understand and predict changes in Earth's environment and conserve and manage coastal and marine resources to meet our Nation's economic, social, and environmental needs

NOAA Vision: An informed society that uses a comprehensive understanding of the role of the oceans, coasts, and atmosphere in the global ecosystem to make the best social and economic decisions

Bubble size is proportional to budget size, based on 2007 expenditures.

What are the trends
that will shape our future?

How can we handle the many
uncertainties about the future?

How will NOAA develop strategy
for the long- and short-term?

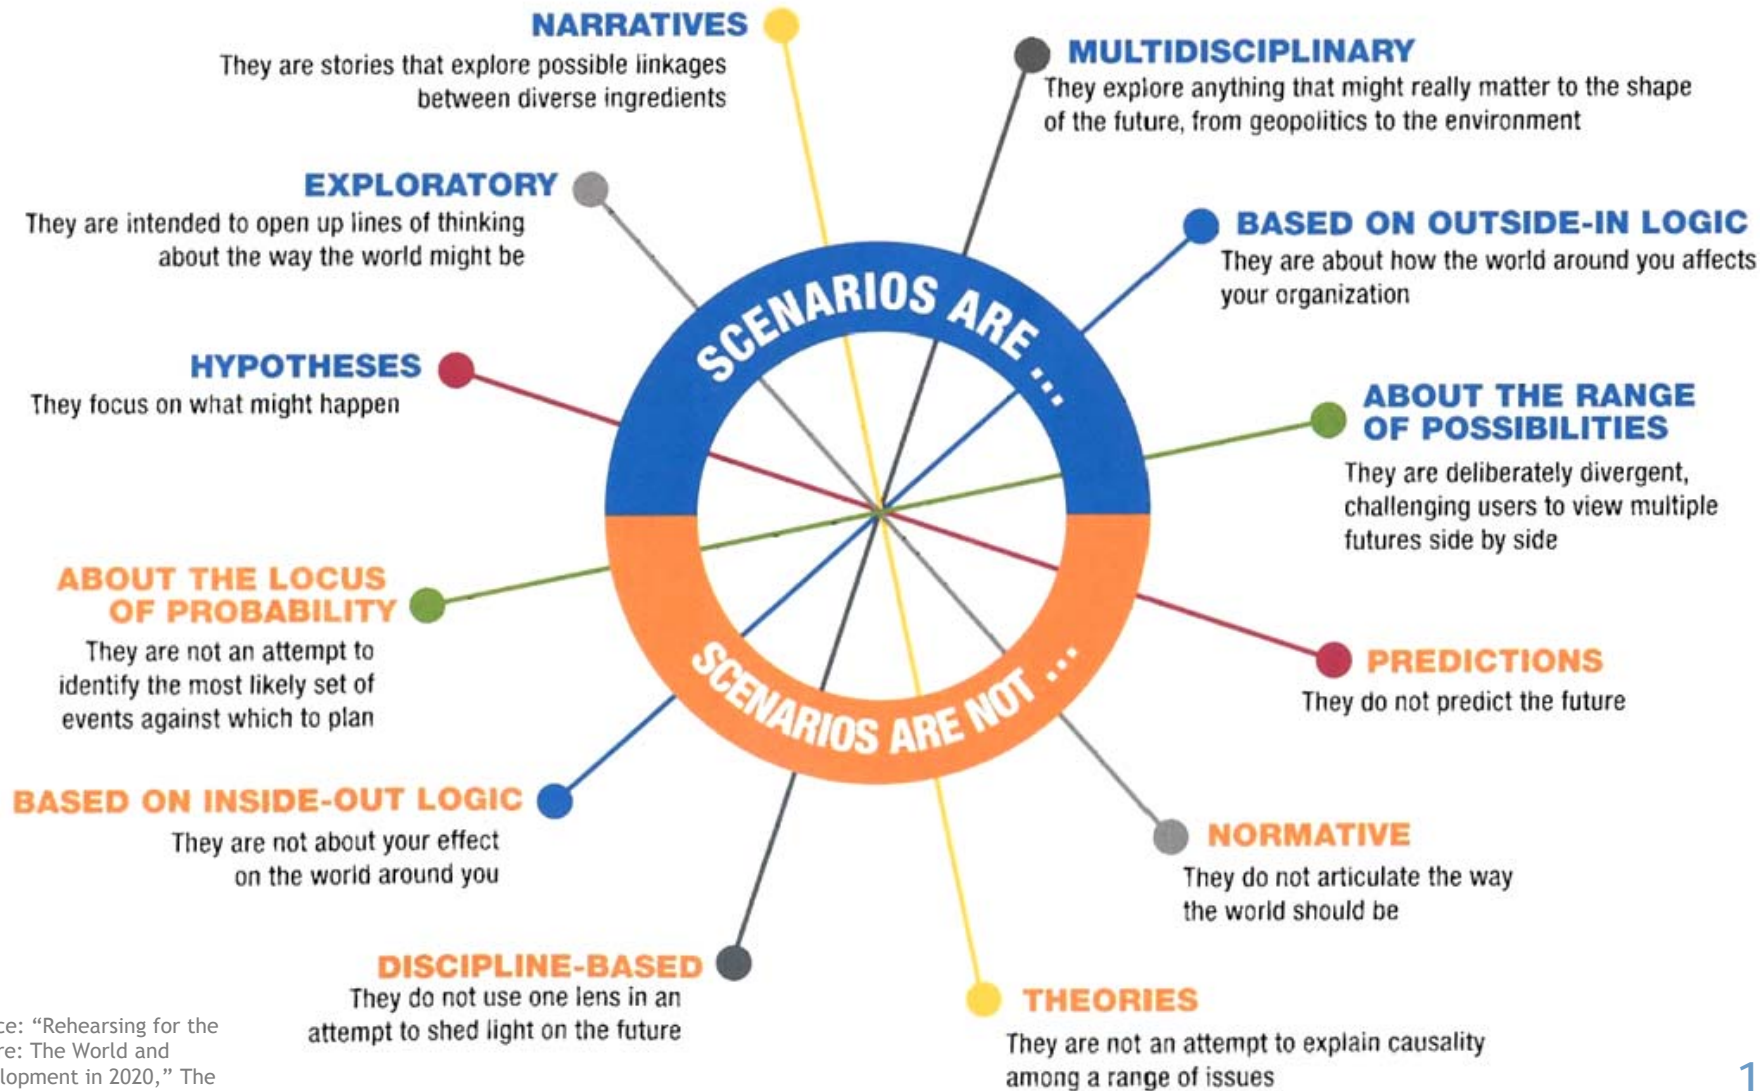

How can you aid the
development of NOAA strategy?

Scenario Planning

- No one can predict the future—but we can identify key forces and imagine how they might combine to form plausible alternative futures
- Scenarios allow people and organizations to grasp complex interactions among economic, political, social, and environmental forces
- Organizations use scenarios to choose goals and objectives that respond to long-term trends and uncertainties about the future

Scenarios Are a Set of Divergent Stories about a future that is fundamentally unknown

Two possible worlds

Given that profound change is inevitable, how will it happen? Will national governments simply **Scramble** to secure their own energy supplies? Or will new **Blueprints** emerge from coalitions between various levels of societies and government, ranging from the local to the international, that begin to add up to a new energy framework?

Focus Questions

- *How can the world attain a high level of sustainable economic growth given the rapidly changing geopolitical landscape of the early 21st century?*
- *What will the balance of power look like in 2025 and to what degree might collaborative policies and frameworks shape the global context?*

Focus Questions

- *What should NOAA's vision, mission, and goals be to serve society for the next 25 years?*
- *What corresponding objectives and strategies should NOAA pursue in the next 5 years?*

Summary of NOAA's *Scenarios for 2035*

Too Little Too Late?

Despite smart economic growth based on alternative energy and sustainable production, and despite collaboration on environmental policy at all levels of government, it may be too late to stop abrupt climate change and its social, economic, and environmental impacts.

Green Chaos

Environmental policy at all levels of government is fragmented and disorganized, but a growing market for alternative energy and other sustainable products leads to smart economic growth and an increasingly harmonious relationship between man and nature through forces of supply and demand.

Carbon Junkies

Environmental policy at all levels of government is collaborative, particularly in developing advanced environmental science and technology, but business-as-usual practices in industry and public focus on traditional metrics of economic success lead, ultimately, to extensive environmental degradation.

What are the trends
that will shape our future?

How can we handle the many
uncertainties about the future?

**How will NOAA develop strategy
for the long- and short-term?**

How can you aid the
development of NOAA strategy?

Why Have a Strategic Plan?

The Next Generation Strategic Plan (NGSP) will:

- Inform and respond to priorities of the new administration
- Engage and respond to stakeholders
- Respond to long-term external challenges facing NOAA
- Meet GPRA and related requirements

The Strategic Plan is a Basis for...

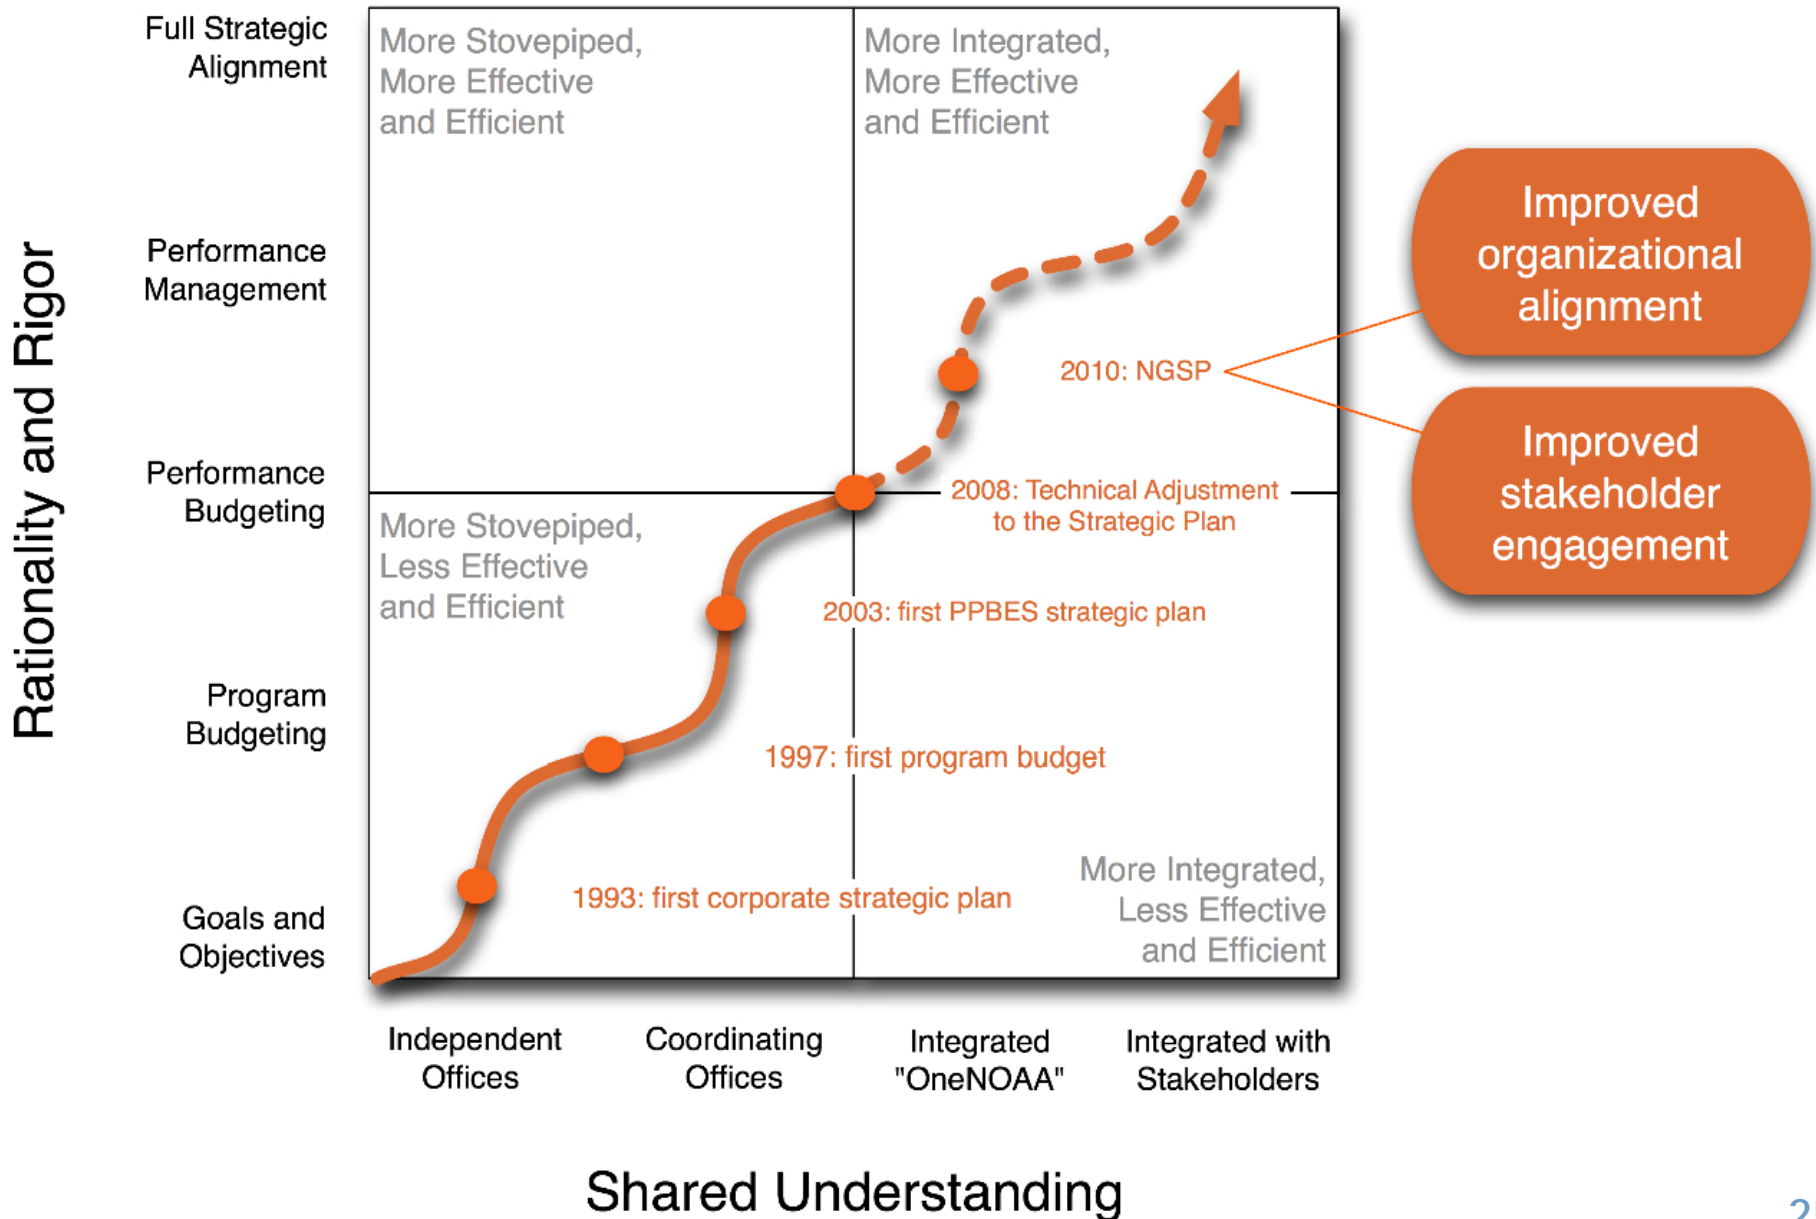

Organizational alignment

- Responsive to changes and uncertainties in the external environment
- Clearly states and explains common organizational goals
- Frames investment choices
- Links planning to budgeting
- Establishes a means for measuring progress to plan
- Establishes discipline in the process and stability in the organization

Stakeholder engagement

- Provides a starting point for conversation and debate
- Generates agreement on challenges and opportunities
- Codifies shared priorities of NOAA stakeholders and leadership
- Facilitates how NOAA works with partners
- Details societal benefits and how NOAA will achieve them

NOAA's Organizational Evolution

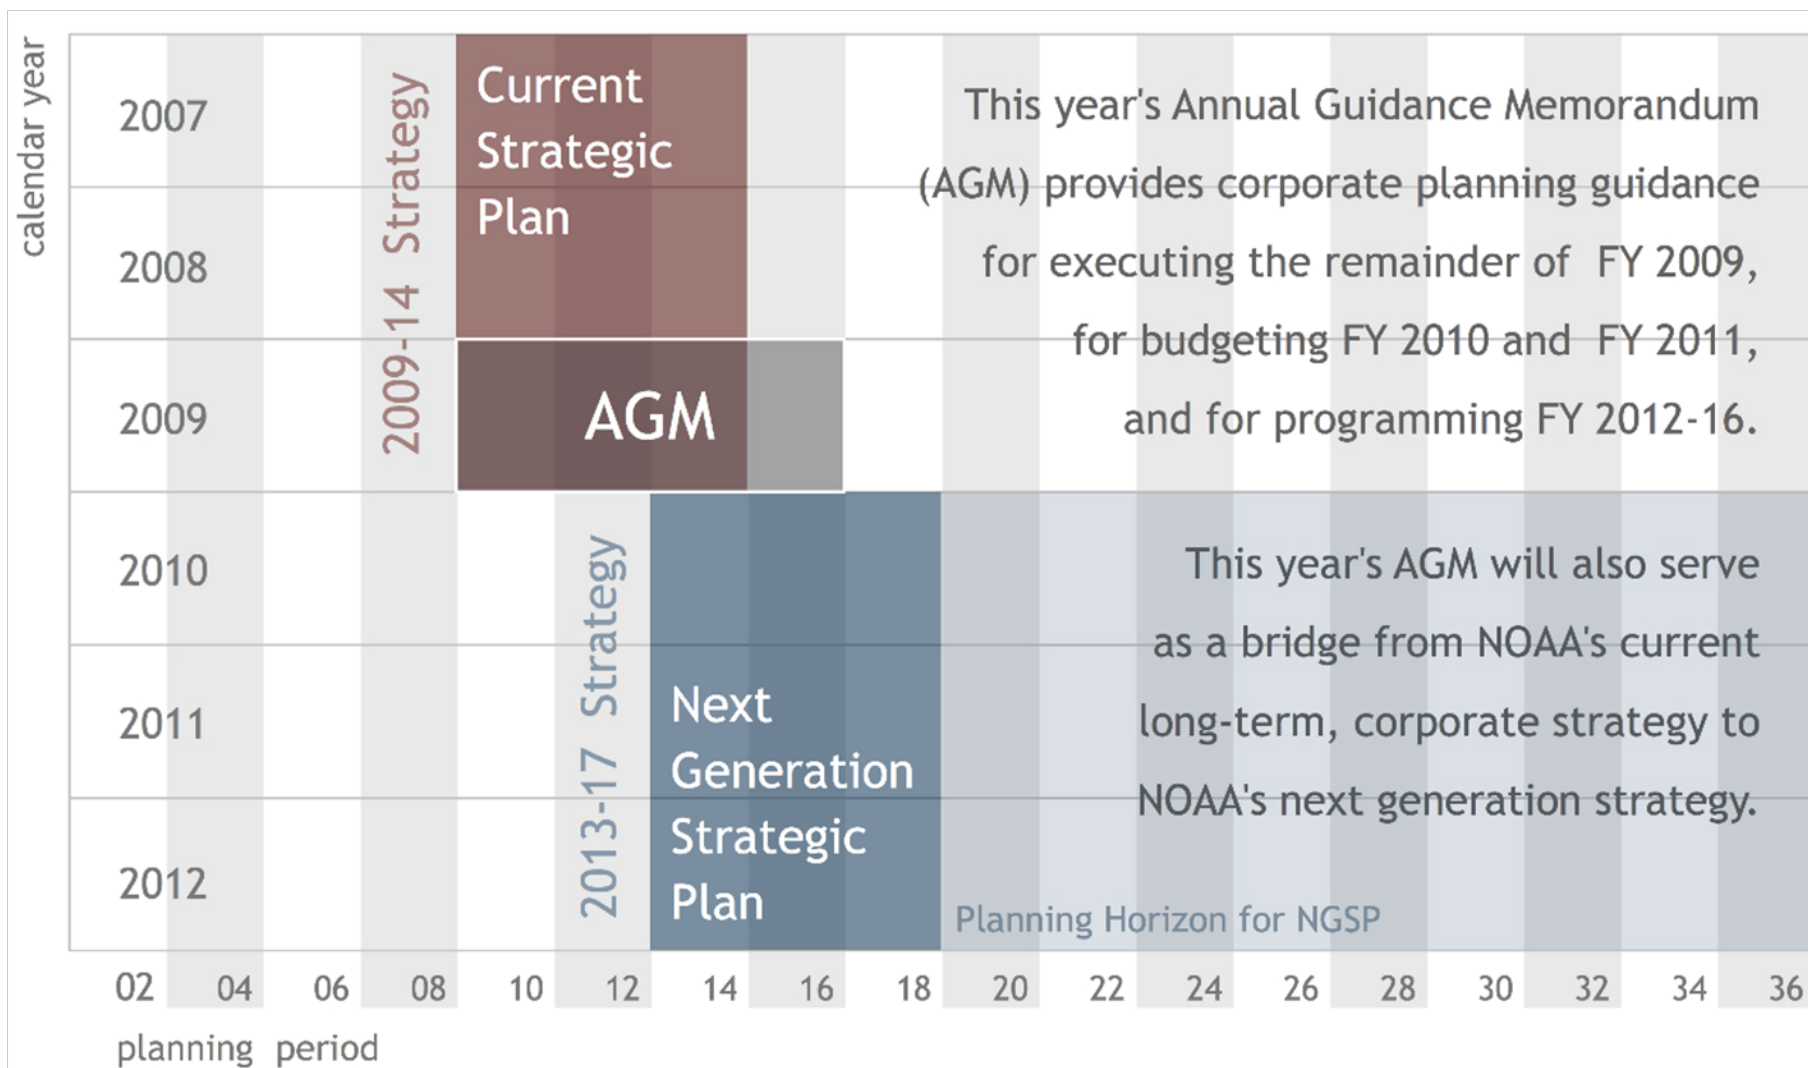

NGSP Design Criteria

- States NOAA's mission and vision
- Establishes outcome-oriented goals and objectives that:
 - Reflect Administration policy priorities
 - Respond to long-term threats and opportunities in the external environment
 - Specify long-term societal benefits
 - Are SMART (specific, measureable, attainable, realistic, and time-bound)
 - Are feasible with respect to NOAA's existing and potential functions
 - Build upon progress achieved under current Strategic Plan
- Describes the functions and capabilities that are required to meet NOAA's goals

NGSP places a 5-Year Strategy Within a 25-year Vision

What are the trends
that will shape our future?

How can we handle the many
uncertainties about the future?

How will NOAA develop strategy
for the long- and short-term?

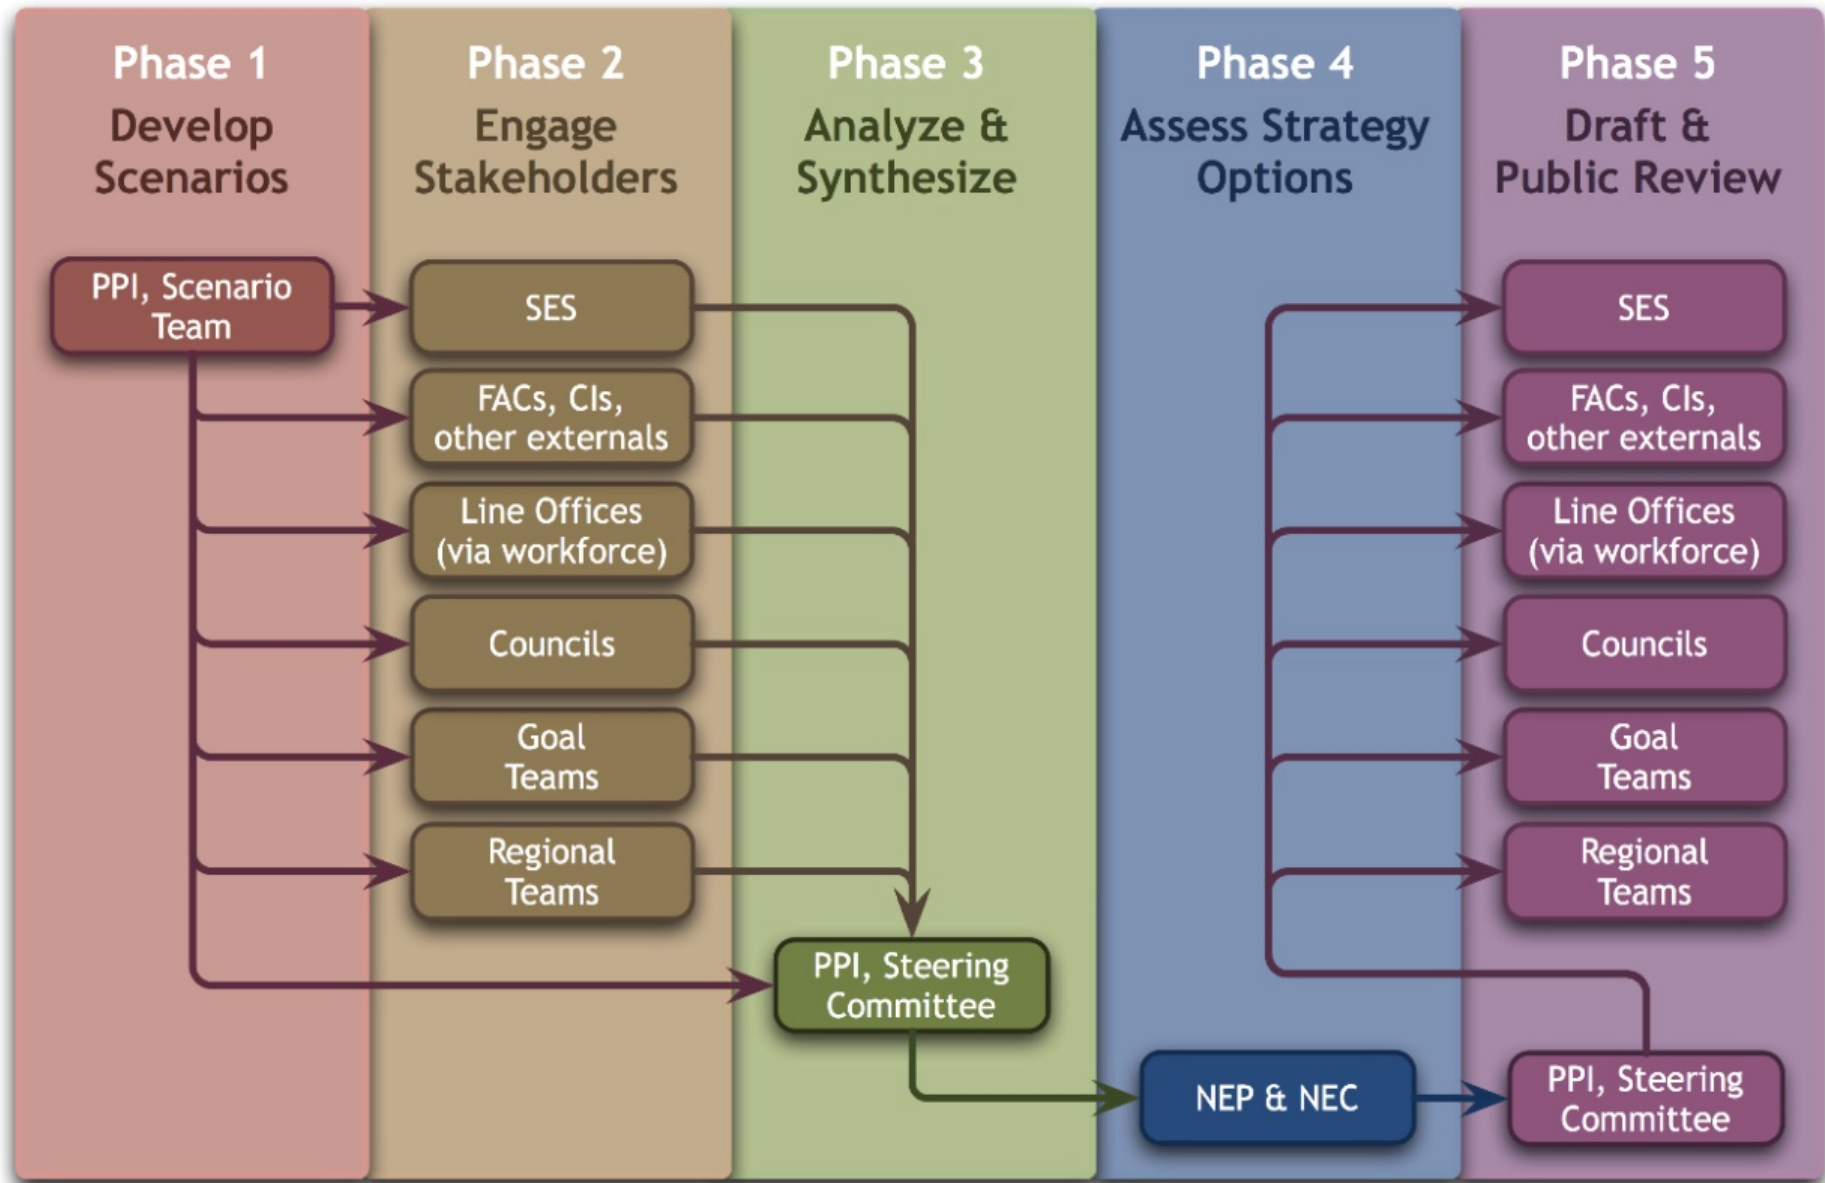

How can you aid the
development of NOAA strategy?

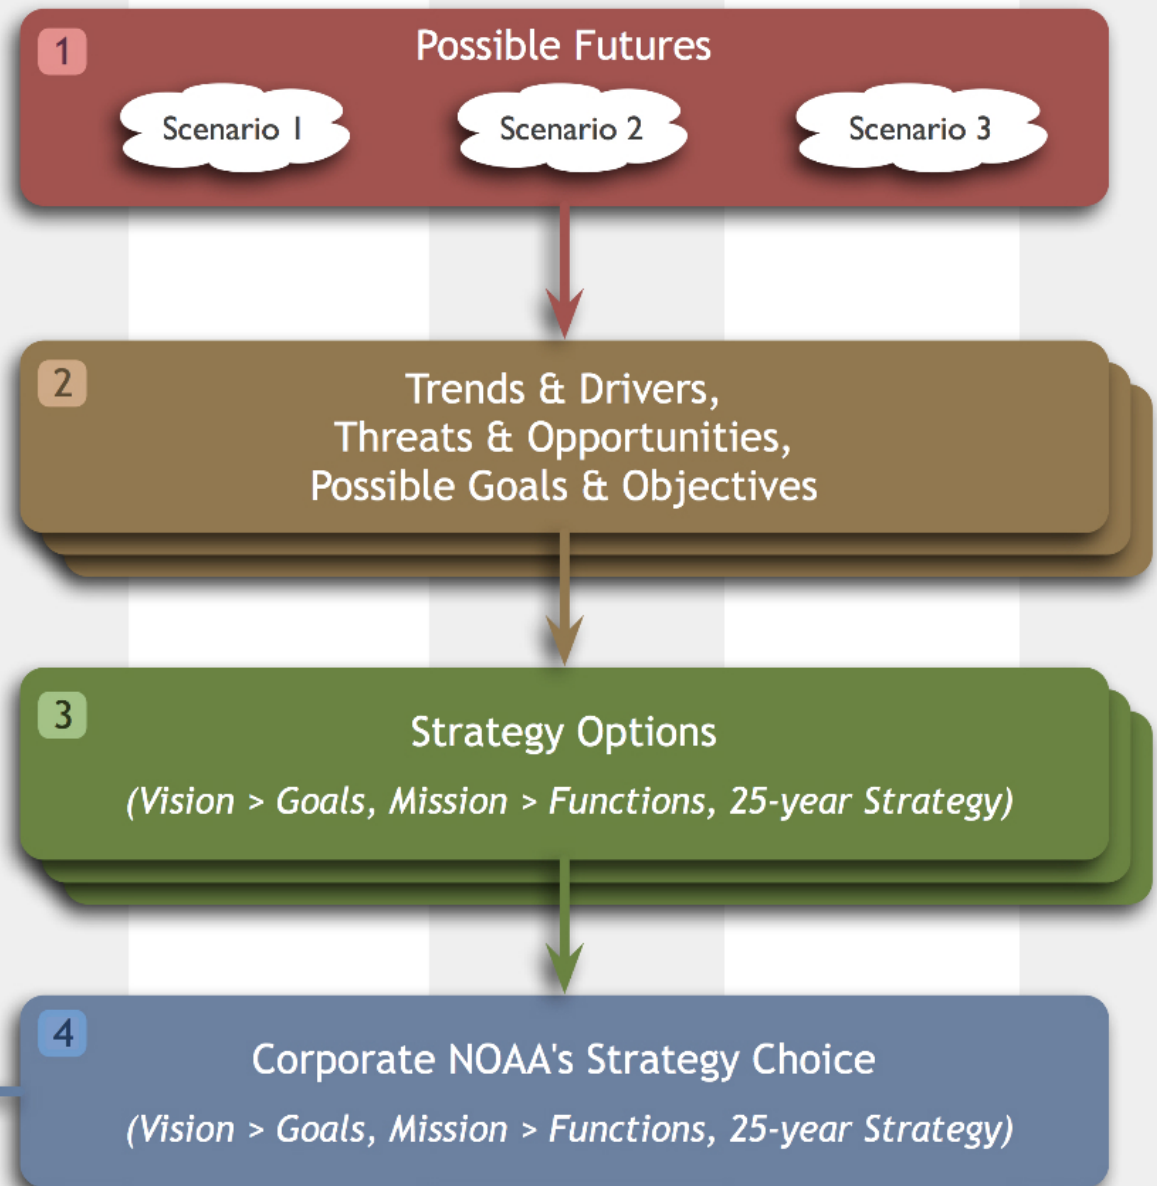

Strategy Development

- Potential goals and objectives will be derived using input from
 - Advisory Committees, Cooperative Institutes, NGOs, and other agencies
 - Regional and national stakeholders (external and internal)
 - Line Offices, Councils, and Regional Teams
 - Goal Teams and Programs
 - Direct staff input
- The draft Strategic Plan will be available for broad review, including by all contributors
 - National Stakeholder Forum
 - Virtual comments via e-mail and Web

The NGSP will Have a Phased Approach to Development

Outputs of Each Phase

2010

2015

2020

2025

2030

2035

3 Fundamental Questions

1. What trends will shape our long-term future?

What long-term trends (scientific, technological, socio-economic, etc.) will shape the future of NOAA over the next 25 years?

2. What challenges or opportunities will we face?

In light of the trends that you have identified, what challenges or opportunities will NOAA face over the next 25 years?

3. What should NOAA strive to accomplish?

Given the long-term trends, challenges, and opportunities that you identified, what should the agency seek to accomplish in the next 25 years?

How Can You Participate?

Visit http://www.ppi.noaa.gov/PPI_Capabilities/ngsp.html

1. Provide input on the 3 fundamental questions:
 - What trends will shape our long-term future?
 - What challenges or opportunities will we face?
 - What should NOAA strive to accomplish?
2. NOAA's *Scenarios for 2035* is designed to stimulate thinking on the above questions. Comments are welcome on the key trends and dynamics in the *Scenarios* document itself.
3. Comment on draft Next Generation Strategic Plan during formal review phase.

Backup

Key External Forces in *Scenarios for 2035*

Nature and Mix of Economic Activity	Environment and Society Interaction	Governance and Decision-making
Global demographics	Water supply variability and change	International laws and agreements
Coastal population growth	GHG emissions (carbon and methane)	US ocean policy
Water supply	Climate change	Cap and trade legislation
Maritime trade	Rapid changes in glaciers and ice sheets	Carbon taxes
Industrial activities in the Arctic	Ocean circulation; AMOC	Climate science research
Level and composition of US economic growth	Arctic sea ice	Government budgets and debt
Level and composition of global economic growth	Ocean acidification	Collaborative modes of governance
U.S. urbanization	Catastrophic events	Privatization
Megacity development	Aquatic resources	Structure of Federal environmental agencies
Food supply and demand	Marine species	Demand for emergency management services
Computer technology	Coastal and ocean water quality	International information sharing
Private sector water and climate information services	Coastal zones	Global environmental information integration
Energy prices	Coastal erosion, inundation	U.S. energy policy; energy “independence”
Energy demand growth	Public opinion	
Electrification of transport	Observing system gaps (esp satellites)	
Alternative energy supplies	GIS tools and data	
	Evolution of models	

Types of Uncertainty that Affect NOAA and Three Possible Futures

Scenario 1: *Too Little Too Late?*

Despite smart economic growth based on alternative energy and sustainable production, and despite collaboration on environmental policy at all levels of government, it may be too late to stop abrupt climate change and its social, economic, and environmental impacts.

2009-2020

2021-2035

*Nature and Mix
of Economy:*
SMART GROWTH

Strong economic growth is fueled by alternative energy investments and global trade. New energy technology facilitates rapid economic development in developing countries. Sustainability as a way of life leads to comprehensive new fisheries management practices, sensible crop rotation, and more efficient water use.

Significant benefits of smart growth are achieved worldwide in less than 20 years, but it's still unknown whether they are forestalling an "abrupt" climate change. Some scientists are beginning to believe the policies were too late and were always too little to halt abrupt climate change.

*Governance and
Decision-Making:*
COLLABORATION

A new collaborative ethic takes hold at all levels of government (international, federal, state, and local). Substantial investments are made to build capabilities and reach effective multiparty agreements on the major environment, economic, and social issues. The US forms a new Department of the Environment.

Economic impacts are greatest outside the United States. Tensions between governments in the East and West begin to fray as it is becoming clear that an entirely new level of commitment will probably be needed to address the relationship between people and the planet.

*Environment
and Society
Interaction:*
DYSFUNCTIONAL

An explosion in maritime trade has significant impact on the natural environment. Coastal populations grow, exposing more people to severe weather and climate effects. Severe geomagnetic storms wreak havoc. Water shortages around the world are exacerbated in many places by biofuels production.

Climate change effects are everywhere. Antarctic ice sheets continue to lose mass. Arctic sea ice disappears in the summertime. Drought conditions are more frequent and severe. Ocean acidification is increasing. Ecosystem disruptions lead to territorial conflicts in Africa, the Middle East, and Central Asia.

Scenario 2: Green Chaos

Environmental policy at all levels of government remains fragmented and disorganized but a growing market for alternative energy and other sustainable products leads to smart economic growth, and market incentives reinforce an increasingly harmonious relationship between society and nature.

2009-2020

2021-2035

*Nature and Mix
of Economy:*
SMART GROWTH

Green markets flourish. Major multinationals, venture capital firms, and state-owned enterprises in Asia invest aggressively in sustainable development solutions. Carbon taxes in the US spur innovation, and the consequences from externality pricing and heavily regulating resource usage do not materialize.

By 2035, global consumers are sophisticated and green, as are many new industries. Asian players control the biggest market share. Green goods and services in developed economies are slowly replacing energy-intensive solutions, while green goods and services growth in developing countries occurs as a result of their rapid economic change.

*Governance and
Decision-Making:*
FRAGMENTATION

Policy makers are overwhelmed by the environmental and economic uncertainties, but a patchwork of regional and local policies succeeds. In-fighting among US agencies abounds and the private sector assumes more government functions. No nation shows leadership as politicians focus on domestic problems. No international standards for environmental data evolve.

The Arctic nations never reach an agreement on sovereignty claims, development of the Arctic, and how to best protect the environment. Russia is constantly using its Navy to try to resolve disputes over the seabed, navigation, and fishing, but lacks the investment funds to pursue much industrial development. The US, Canada, and Norway generally coordinate, but still largely go their separate ways.

*Environment
and Society
Interaction:*
HARMONIOUS

Carbon tax revenue is returned to individuals by contributing to their retirement accounts and health care insurance costs. There is a trend of counter urbanization, with cities losing population to rural areas because of better living conditions. Economic incentives are also used by states and federal agencies to change agricultural and fishing practices.

Scientists can't agree on whether abrupt climate change is taking place. While the changes are muted they're still visible in a number of places. Water scarcity is getting worse around the world, while at the same time demand for food is rising faster than anyone expected. Fish stocks improve because of new regulations and commercial innovation.

Scenario 3: Carbon Junkies

Environmental policy at all levels of government is collaborative, particularly in developing advanced environmental science and technology, but business-as-usual practices in industry and public focus on traditional metrics of economic success lead, ultimately, to extensive environmental degradation.

2009-2020

*Nature and Mix
of Economy:
BUSINESS AS
USUAL*

In both developed and developing countries, old economic systems continue to exploit energy for economic growth. Consumer products like cars and appliances are cheap due to global demand, global trade agreements, and massive energy- and water-development investments. GDP growth is the highest priority, but the US economy falters and deficits rise.

*Governance and
Decision-Making:
COLLABORATION*

Institutions around the world cooperate on environmental and disaster-relief issues, but budgets are tight, environmental programs are cut, and governments struggle to respond to continued catastrophic-events. A resource race to stake claims on the Arctic seabed spawns new international agreements. The effects of climate change drive new international GHG agreements with binding commitments.

*Environment
and Society
Interaction:
DYSFUNCTIONAL*

Worldwide energy resource exploitation increases significantly. Hydrocarbon energy resources are further developed in the US and nuclear generating plants also see major increases. Water shortages in the developing world are a problem, as are major catastrophes from floods, earthquakes, and typhoons. Fish stocks around the world begin to disappear.

2021-2035

Energy demand rises dramatically, while supply is still mainly oil and coal. Marine transport activity is increasingly significant because of economic growth in developing countries and open trade policies around the world. Arctic waters open, and substantial industrial activity is already occurring above the Arctic Circle.

While progress was initially slow in implementing the GEOSS vision, the US, EU, and China ultimately agreed to support the effort. A global environment information utility becomes available. Scientists agree that large-scale change in the climate system is taking place and the change cannot be reversed for decades, even with major mitigation efforts worldwide.

Sea levels rise, oceans acidify, droughts persist, Arctic ice disappears in the summer, cropland disappears in many countries, migration patterns in Asia and Africa change rapidly. Adaptation becomes the most important issue. A cap and trade system, supported by new climate observations and models, provides incentive for utilities to sequester CO₂.
